Empathize & Discover

Date	3 October 2026
Team ID	SWTID-2026-1299
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Empathy Map Canvas: ServiceNow Incident Management

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes .

It is a useful tool to helps teams better understand their users. Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

Example:

Empathy Map Matrix (Mapped to Project Milestones 1 - 6)

Milestone	Think & Feel	Hear	See	Say & Do	Pain	Gain
Milestone 1	How can I ensure users fill out required Incident fields consistently?	Management wanting cleaner incident data & standard practices.	Incomplete ticket entries and missing mandatory data.	Configure UI Policy on Incident table to dynamically set mandatory, read-only, or visible fields.	Inconsistent data entry.	Consistent data practices.
Milestone 2	Why is ticket urgency often missing or inaccurate?	Support teams asking for better incident prioritization.	Incorrect or unselected urgency levels on new incidents.	Create UI Policy Action for Urgency field to enforce mandatory/visible/read-only behavior.	Unclear incident urgency.	Accurate prioritization.
Milestone 3	I need the form to respond dynamically when users change a field value.	Users asking for faster forms and interactive feedback.	Static forms that do not auto-update related fields or show warnings.	Write onChange Client Script using g_form API to update fields or display messages.	Manual data updates.	Interactive form UX.
Milestone 4	How do I prevent users from submitting invalid or incomplete records?	Data analysts complaining about erroneous ticket submissions.	Form submissions saved despite missing required conditions.	Write onSubmit Client Script with g_form API to validate data and block invalid saves.	Corrupted / bad data.	Guaranteed data accuracy.
Milestone 5	Users are bypassing form rules by editing directly in the list view!	Process managers asking to enforce	Direct inline list edits causing unvalidated field changes.	Write onCellEdit Client Script to validate and allow/prevent list view edits.	Bypassed validation rules.	Controlled inline edits.

		validation on list view edits.				
Milestone 6	Are all UI Policies, Actions, and Client Scripts working correctly together?	Stakeholders requesting end-to-end verification across forms and lists.	Potential conflicts between scripts and UI policies under edge cases.	Test all form & list configurations across valid/invalid inputs, field changes, and inline edits.	Unchecked errors in prod.	Verified robust solution.

Project Milestones (Verbatim)

milestone 1: Create a UI Policy on the Incident table to dynamically control the behavior of form fields based on specific conditions. Configure the UI Policy to make selected fields mandatory, read-only, or visible when the defined condition is met. This helps ensure that users provide the required information and follow consistent data-entry practices while creating or updating Incident records.

milestone 2: Create a UI Policy Action for the Urgency field on the Incident form to control its behavior based on the conditions defined in the UI Policy. Configure the action to make the Urgency field mandatory, visible, or read-only as required. This ensures that the appropriate urgency information is captured consistently and helps users prioritize incidents accurately.

milestone 3: Create an onChange Client Script on the Incident form to dynamically perform an action whenever a specified field value is changed. The script should use the g_form API to update related fields or display appropriate messages based on the selected value. This helps automate form behavior, improve data accuracy, and provide users with a more interactive Incident form experience.

milestone 4: Create an onSubmit Client Script on the Incident form to validate the information entered by the user before the record is saved or submitted. Use the g_form API to check whether the required conditions are satisfied and prevent submission when invalid or incomplete data is found. Display an appropriate message to guide the user in correcting the information before saving the Incident.

milestone5: Create an onCellEdit Client Script on the Incident table to control and validate field values when users edit Incident records directly from a list view. The script should check the updated value and allow or prevent the change based on the defined conditions. This helps maintain data accuracy and ensures that users follow the required validation rules even when making inline edits from the Incident list.

milestone6: Test all the configured UI Policies, UI Policy Actions, and Client Scripts on the Incident form and list view to ensure they work as expected. Verify that fields become mandatory, visible, read-only, or updated based on the defined conditions. Test different scenarios, including valid and invalid inputs, form submission, field changes, and inline list edits, and confirm that the expected validation messages and behaviors are triggered correctly.

Project 6: Milestone Description
