

Implement Client Scripts and UI Policy

SCENARIO	Entice	Enter	Engage	Exit	Extend
Implementing client scripts and UI policies on the ServiceNow Incident form	How does someone initially become aware of this process?	What do people experience as they begin the process?	In the core moments in the process, what happens?	What do people typically experience as the process finishes?	What happens after the experience is over?
Steps What does the person (or group) typically experience?	Notice data-entry issues	Create UI Policy (Milestone 1)	Create onChange Client Script (Milestone 3)	Test UI Policies & Client Scripts (Milestone 6)	Review results
	Identify Incident form fields	Create UI Policy Action for Urgency (Milestone 2)	Create onSubmit Client Script (Milestone 4)	Verify validation messages	Document the work
	Define conditions & rules		Create onCellEdit Client Script (Milestone 5)		Plan further improvements
Interactions What interactions do they have at each step along the way? People: Who do they see or talk to? Places: Where are they? Things: What digital touchpoints or physical objects would they use?	Incident table and form in the ServiceNow instance	Incident form > Configure > UI Policies	Incident form > Configure > Client Scripts	Incident form and list view in the instance	Project report / documentation
	Trainer / mentor and project team	UI Policy Actions related list on the UI Policy	g_form API in the script editor	Test Incident records	Mentor or trainer for feedback
			Incident list view (inline editing)		
Goals & motivations At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")	Help me understand which fields need control	Help me make fields mandatory, read-only, or visible	Help me automate form behavior with g_form	Help me confirm everything works as expected	Help me present my work clearly
	Help me avoid incomplete Incident records	Help me capture Urgency consistently	Help me stop invalid data before it is saved	Help me avoid missed edge cases	Help me see what I could build next
			Help me validate inline list edits		
Positive moments What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?	Clear idea of what the project will achieve	Fields change instantly when the condition is met	Seeing the form respond to a field change	Validation messages appear correctly	Feeling of completing a working project
		Easy to configure without scripting	Helpful message guides the user on submit	All scenarios pass	
Negative moments What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?	Unsure which fields need rules	Condition set incorrectly, so the policy does not trigger	Script errors or wrong field names	Time-consuming to test every scenario	Hard to remember all configurations
	Too many conditions to plan	UI Policy order and Run scripts can confuse	onCellEdit behaves differently from form scripts	Bugs found only after saving	
Areas of opportunity How might we make each step better? What ideas do we have? What have others suggested?	Prepare a list of fields and rules before starting	Use clear names and test the condition builder first	Use clear messages with g_form.addErrorMessage	Prepare a test-case checklist for valid and invalid inputs	Capture screenshots and steps
			Add comments in scripts		Extend to other tables or more fields
