

**Project Design Phase-II**  
**Solution Requirements (Functional & Non-functional)**

|               |                                                |
|---------------|------------------------------------------------|
| Date          | 3 October 2026                                 |
| Team ID       | SWTID-2026-1299                                |
| Project Name  | Implement Client Script & UI Policy (Incident) |
| Maximum Marks | 4 Marks                                        |

**Functional Requirements:**

Following are the functional requirements of the proposed solution mapped across all 6 ServiceNow milestones:

| FR No. | Functional Requirement (Epic)                                | Sub Requirement (Story / Sub-Task)                                                                                                                                                                                                                    |
|--------|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FR-1   | Milestone 1: Create UI Policy on Incident                    | <ul style="list-style-type: none"><li>• Make 'Subcategory' mandatory when 'Category' is 'Software'</li><li>• Hide low-priority auxiliary incident fields on initial form load</li><li>• Apply dynamic view rules based on caller department</li></ul> |
| FR-2   | Milestone 2: Create UI Policy Action - Urgency               | <ul style="list-style-type: none"><li>• Make 'Urgency' read-only when Incident State is Resolved or Closed</li><li>• Lock 'Priority' field value based on Impact and Urgency matrix rule</li></ul>                                                    |
| FR-3   | Milestone 3: Create onChange Client Script                   | <ul style="list-style-type: none"><li>• Trigger alert/notification when 'Caller' field value changes</li><li>• Clear 'Assigned To' field dynamically when 'Assignment Group' changes</li></ul>                                                        |
| FR-4   | Milestone 4: Create onSubmit Client Script (Save Validation) | <ul style="list-style-type: none"><li>• Validate that 'Short Description' is not left blank before form submission</li><li>• Ensure valid closure notes are provided before closing an incident ticket</li></ul>                                      |
| FR-5   | Milestone 5: Create onCellEdit Client Script                 | <ul style="list-style-type: none"><li>• Intercept list-view inline edits on 'State' column to prevent invalid status jumps</li><li>• Validate state transition constraints before saving list edits</li></ul>                                         |
| FR-6   | Milestone 6: Testing the Configuration                       | <ul style="list-style-type: none"><li>• Execute form scenario tests for client scripts and UI policies</li><li>• Verify browser console logs for error-free execution across roles</li></ul>                                                          |

### Non-functional Requirements:

Following are the non-functional requirements of the proposed ServiceNow solution:

| FR No. | Non-Functional Requirement | Description                                                                                                                         |
|--------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| NFR-1  | Usability                  | The form UI must remain clean, intuitive, and clutter-free, presenting only relevant mandatory fields based on contextual triggers. |
| NFR-2  | Security                   | Client scripts and UI policies must respect user role boundaries (ITIL vs. admin), preventing unauthorized field modifications.     |
| NFR-3  | Reliability                | Client-side scripts must execute reliably across major modern browsers (Chrome, Firefox, Edge) without causing client-side freezes. |
| NFR-4  | Performance                | Synchronous and asynchronous script executions (GlideAjax) must run efficiently, rendering field updates in under 500ms.            |
| NFR-5  | Availability               | Incident configuration workflows must maintain 99.9% uptime within the ServiceNow developer instance environment.                   |
| NFR-6  | Scalability                | The implemented rules must scale smoothly to handle bulk incident records and list-view edits without performance degradation.      |
