

Implement Client Script and UI Policy

Project Documentation Format

1. Introduction

- *Project Title: Implement Client Script and UI Policy*
- *Team Members and Milestones:*
 - *Shalini - Milestone 3*
 - *Sowmiya - Milestone 1 and 6*
 - *Srinithi - Milestone 2*
 - *Shalini Kamatchi - Milestone 4*
 - *Varshini - Milestone 5*

2. Project Overview

- *Purpose: To implement Client Scripts and UI Policies in ServiceNow to control form behaviour, validate user inputs, and improve the user interface.*
- *Features: Client-side validation, dynamic field behaviour, field visibility control, mandatory/read-only field control, and improved form interaction.*

3. Architecture

- *Platform: ServiceNow.*
- *Client Side: Client Scripts are used to execute JavaScript in the user's browser and control form behaviour.*
- *UI Layer: UI Policies are used to dynamically change field properties such as mandatory, visible, and read-only based on conditions.*
- *Data Layer: ServiceNow tables store the form and record information.*

4. Setup Instructions

- *Prerequisites: ServiceNow instance, user account with required permissions, and basic knowledge of JavaScript.*
- *Setup: Log in to the ServiceNow instance, open the required application/table, create the required Client Scripts and UI Policies, define their conditions, and test the form behaviour.*

5. Project Structure

- *Client Scripts: Contains the client-side logic used to validate and control form behaviour.*
- *UI Policies: Contains the conditions and field actions used to dynamically control the form.*
- *Forms and Fields: The Client Scripts and UI Policies are applied to the required ServiceNow forms and fields.*

6. Running the Application

- *Log in to the ServiceNow instance.*
- *Open the required form.*
- *Enter or modify the field values required by the project.*
- *Observe the Client Script and UI Policy actions on the form.*
- *Submit the form and verify the result.*

7. API Documentation

- *Document any APIs or ServiceNow server-side interfaces used by the project.*
- *Include the API name, purpose, request details, parameters, and expected responses, if applicable.*
- *If no external API is used, mention that the project uses ServiceNow configuration and client-side scripting*

without a separate API.

8. Authentication

- *Explain how authentication and authorization are handled in the ServiceNow project.*
- *Include details about user roles, permissions, or access controls used to access the forms and project features.*
- *UI Policies can dynamically make fields mandatory, visible, or read-only according to the defined conditions.*

9. User Interface

- *Provide screenshots or GIFs showing the ServiceNow form before and after applying Client Scripts and UI Policies.*
- *Show the dynamic changes in field visibility, mandatory status, read-only status, and validation behaviour.*

10. Testing

- *Test the Client Scripts with different field values and form conditions.*
- *Verify that the expected validation and field behaviour occurs.*
- *Test UI Policies to confirm that fields become visible, hidden, mandatory, or read-only as configured.*
- *Check form submission with valid and invalid inputs.*

11. Screenshots or Demo

- *Provide screenshots of the configured Client Scripts and UI Policies.*
- *Provide screenshots of the ServiceNow form showing the expected output.*
- *If available, provide a link to the project demonstration.*

12. Known Issues

- *Document any known issues related to Client Script execution, UI Policy conditions, field behaviour, or ServiceNow configuration.*
- *Mention any limitations that users or developers should be aware of.*

13. Future Enhancements

- *Add more Client Scripts for advanced form validation.*
- *Create additional UI Policies for different form conditions.*
- *Improve dynamic form behaviour based on user roles and field values.*
- *Extend the implementation to additional ServiceNow tables and forms.*
