

Project Name: Create Onchange Client Script

Milestone: 3

Problem Statement

Automatic Urgency Setting Based on Incident Impact in ServiceNow

In ServiceNow, the **Incident Management** process requires users to enter important details such as Impact and Urgency for every incident. Manually updating the Urgency field whenever the Impact changes can be time-consuming and may result in incorrect or inconsistent values.

To overcome this issue, an automated solution can be implemented using a **Client Script** in ServiceNow. The Client Script will be configured as an **onChange** script for the **Impact** field in the Incident table. Whenever the user changes the Impact value to **High**, the system will automatically set the **Urgency** field to **High**.

The system will also display an informational message to notify the user that the Urgency has been automatically updated. The script will not execute while the Incident form is loading or when the Impact field is empty.

This automation reduces manual effort, improves data accuracy, maintains consistency in incident records, and helps users quickly identify incidents that require higher priority attention.
