

Project Name: Create OnSubmit Client Script(Save Validation)

Milestone: 4

Problem Statement

Prevent Saving High-Impact Incidents Without an Assigned User in ServiceNow

In ServiceNow Incident Management, it is important to ensure that **High Impact incidents** are properly assigned to a responsible user. However, users may accidentally try to save an Incident without filling in the **Assigned To** field, which can lead to incomplete incident records and delays in handling critical incidents.

To overcome this issue, an **onSubmit Client Script** can be implemented on the Incident table. The script should check whether the Incident has **High Impact** and whether the **Assigned To** field is empty. If both conditions are true, the system should prevent the Incident from being saved and display an appropriate error message asking the user to enter an Assigned To value.

This validation ensures that High Impact incidents always have a responsible person assigned before they are saved, improving data accuracy and incident management.
