

Project Name: Create OnSubmit Client Script(Save Validation)

Milestone: 4

Solution

To ensure that **High Impact incidents** are always assigned to a responsible user, an **onSubmit Client Script** can be created in ServiceNow. The script will validate the **Assigned To** field when the user tries to save an Incident.

First, navigate to **System UI → Client Scripts** and click **New**. Create the Client Script with the following details:

- **Name:** Prevent save if Assigned To missing
- **Table:** Incident
- **Type:** onSubmit
- **Active:** True

Enter the following script in the Script section:

```
function onSubmit() {  
    if (g_form.getValue('impact') == '1' &&  
        g_form.getValue('assigned_to') == '') {  
  
        g_form.showErrorBox(  
            'assigned_to',  
            'Assigned To is mandatory for High impact  
incidents.'  
        );  
  
        return false;  
    }  
  
    return true;  
}
```

The script checks two conditions when the user tries to save the Incident. First, it checks whether the **Impact** field is set to **High**. Then, it checks whether the **Assigned To** field is empty.

If the Incident has High Impact and no user is assigned, the script displays an error message:

"Assigned To is mandatory for High impact incidents."

The `return false` statement prevents the Incident from being saved. If the conditions are not met, the script returns `true`, allowing the record to be saved normally.

After entering the details and script, click **Submit** to save the Client Script.

Result

When a user tries to save a **High Impact Incident** without entering an **Assigned To** user, the system prevents the save and displays an error message. Once an appropriate user is assigned, the Incident can be saved successfully. This helps maintain complete and accurate Incident records.

Catalog Client ScriptsNew recordSubmit

New client-scripts are run in strict mode, with direct DOM access disabled. Access to jQuery, prototype and the window object are likewise disabled. To disable this on a per-script basis, configure this form and add the "Isolate script" field. To disable this feature for all new globally-scoped client-side scripts set the system property "glide.script.block.client_globals" to false.
