

Project Name: Create OnCellEdit Client Scrip

Milestone: 5

Problem Statement

Prevent Direct State Changes Through List Editing in ServiceNow

In ServiceNow Incident Management, users can edit certain Incident fields directly from the **Incident list view** without opening the complete Incident record. Although this feature is convenient, allowing users to directly modify the **State** field through list editing may result in unauthorized or accidental changes to an Incident's status.

To prevent this issue, an **onCellEdit Client Script** can be implemented on the **Incident** table. The script should monitor changes made to the **State** field from the list view. Whenever a user attempts to modify the State directly through list editing, the system should prevent the change and display a message instructing the user to open the Incident record before updating its State.

This validation helps maintain proper control over Incident state changes and reduces accidental or unauthorized updates made through the list view.
